

Platform 2D Shooter — Project Brief

A 2D wave-survival platform shooter built in Python/Pygame. The player fights increasingly difficult waves of enemies inside a platforming arena. After each level, the player chooses an upgrade such as more health, more damage, faster fire rate, better movement, or utility effects like piercing bullets.

The game should focus on simple but satisfying movement, readable combat, and gradually increasing enemy variety. The first version should have 10 levels, 3 enemy types, one arena, a basic shooting system, simple placeholder graphics, a health bar, level counter, upgrade screen, and game-over screen.

Enemy progression:

- Levels 1–2: basic walking/jumping enemies.
- Levels 3–5: basic enemies plus slower, bulkier tank enemies.
- Levels 6–10: basic enemies, tanks, and flying enemies.
- Level 10 can optionally include a final boss or final wave.

The first playable milestone should be very small: a player who can move and jump on platforms, one enemy that chases the player, bullets that damage the enemy, player health, death, and restart. Once that loop feels fun, add level progression, upgrades, tanks, flying enemies, and polish.
